

REVIEWS OF *SURVIVING PROSTATE CANCER*

Mr. Gopaul has done an outstanding job of presenting, in simple and understandable terms, the confusing and frightening topic of prostate cancer. The inclusion of his personal experiences with this disease has led to a very readable resource of material for the newly diagnosed and previously treated patient. This book is crammed full of information, including the scientific references, and answers all the questions that patients may have. I would highly recommend this book to those who are suffering with prostate cancer.

Dr. John Warner, MD
Urologist, Burnaby, BC

As one of Harold's former students and as a practicing genitourinary Radiation Oncologist, I can comment on two things. Harold Gopaul has a gift as an educator, and any man who has decided to have a radical prostatectomy will benefit from this book. In fact, he uncovers many stones related to his personal journey through the diagnosis and treatment of his own prostate cancer that will enlighten any man faced with the same prospects.

Dr. Scott Tyldesley, MD
Radiation Oncologist (BC Cancer Clinic, Vancouver, BC)

The wise counsel and perspective of a fellow cancer survivor, one who has already travelled the journey, can provide invaluable guidance and support to someone newly diagnosed with cancer. Harold's book, Surviving Prostate Cancer – A Personal Journey and Second Opinion, is written from this valuable perspective: a man who has been through the challenging journey of prostate cancer diagnosis and treatment, supporting others through these same challenges. We can learn so much from each other, and Harold's book is a testament to this.

Dr. Hal Gunn, B.Sc., MD
Director of the Centre for Integrated Healing (Vancouver, BC)

Harold's book, Surviving Prostate Cancer – A Personal Journey and Second Opinion, is a clear, comprehensive, and carefully researched study of Prostate Cancer; its risks, diagnosis, prevention, and treatment options. The author has very effectively woven his own experience with Prostate Cancer into current understandings of the disease. The book is an excellent resource for everyone who has been or might be affected by Prostate Cancer—men, women, and families. As a teacher and biologist, I heartily recommend this book.

Dr. Judith Fischer, PhD
Biology Professor (Massachusetts Institute of Technology)
